

GitHub OSINT Threat Intelligence Platform

Candidate Assignment

Objective

Build an end-to-end application that monitors public GitHub repositories to identify potential cyber threats using OSINT techniques. The platform should detect exposed credentials, fake Android apps, phishing kits, brand impersonation, malware repositories, and suspicious projects.

Scope

Keyword-based GitHub search with scheduled scanning. Organization monitoring for: FYND, Zerodha, Angel One, Groww, Upstox, INDmoney, PhonePe, Google Pay, Paytm, BharatPe, Google, Microsoft, AWS, Stripe, OpenAI. Detect secrets (AWS keys, GitHub PATs, MongoDB URIs, Firebase keys, JWTs, SSH keys, API tokens). Identify fake APKs, phishing repositories, banking/trading clones, and brand impersonation. Risk score and classify findings (Critical/High/Medium/Low). Dashboard with search, filters, charts, repository details, and alerts.

Technology Expectations

Backend: Node.js (NestJS preferred), REST APIs, MongoDB/Postgres, background jobs, logging, authentication, scheduling.

Frontend: Next.js + React + Tailwind CSS.

Deployment: Frontend on Vercel, Backend on AWS/Render/Railway, Database on MongoDB Atlas.

Page 2

Deliverables

GitHub repository with clean commit history. Live frontend URL. Live backend API URL. README with setup instructions. Architecture diagram. Swagger/OpenAPI documentation. .env.example file. 5–10 minute demo video.

Evaluation Criteria

AreaWeight Backend Architecture & APIs20% Frontend & UX15% GitHub Integration & Scheduling10% OSINT & Threat Detection Logic20% Security & Code Quality15% Deployment & Documentation10% Testing & Scalability10%

Bonus

AI-assisted repository classification, VirusTotal integration, Docker, GitHub Actions CI/CD, Redis/BullMQ, OCR, semantic search, Kubernetes deployment.

Timeline

Expected completion: 5–7 days. Candidates should focus on production-ready architecture, security, maintainability, and clean engineering practices rather than building every possible feature.
